

Criterion A: Planning

Defining the problem :

My client, Ms Z, is a student who enjoys listening to music while doing homework, studying, or even in her free time. She has an issue about creating playlists with good variety, music she already likes, and new music that she might enjoy. She has tried to use AI on her preferred platform of choice but does not enjoy the algorithm it uses since it is AI. She believes that a humanized algorithm with personal implications would allow her problem to be solved. She mentioned her problem of feeling bored due to this. As she was talking about his problem, I thought that it was good material for my Internal Assessment because Ms Z wanted to have an IT solution for his problem. Computer Science teacher approved this idea.

In order to analyze this issue I decided to meet with Ms Z to have an interview and find out details for my future software.

We met in October 2024 and discussed what this program would be able to do. She specifically mentioned that he would like to be able to see the most recent and previous playlists made as well as save them to a platform so she can always have access to them. However, she also mentioned how she would like this program to be adaptable for anyone to use depending on their preferences.

Rationale for proposed solution:

Java is the right program to use for this project because it is a flexible program that can be used on different devices as long as java is available. Ms Z typically carries her laptop which has java available which will make java a good fit for this project. It is important to her to be able to access it through her laptop because she usually has a lot to do throughout the day. Having it on a device always nearby allows him to save time, since it is easily accessible. This would not be possible if I was to use another program because not all programs are accessible on multiple devices or computers. Java is also an Object-Oriented program which allows me to model real world scenarios. For example, in Java I can create runner objects to easily organize the system. Because of this, I felt that Java was the best choice for this project. If I were to use a different program, I would not be able to meet the wishes that the client has.

Word count: 400

Stating success criteria

1. Program will be able to create playlists based on user input.
2. Program will be able to save a playlist created to view at a later date.
3. Users will be able to delete created playlists.
4. Program will display created and saved playlists.
5. Users will be able to select genre, artist, albums, and songs, to add to the playlists.
6. Playlists will be able to be composed of various genres and artists.
7. Program will include multiple genres in order to provide a variety of options for the user.
8. Program will validate the user input in order to prevent user error.
9. Users will be able to generate playlists with only the playlist length and genre imputed.
10. Users will be able to control the playlist length of created and generated playlists.
11. The user will be able to expand playlists by adding new songs or genres.
12. The program will have a graphical user interface (GUI) which will allow for a better user experience.
