

Criterion E: Evaluation

Evaluation of the product

- 1. Program will be able to create playlists based on user input. -works well
- 2. Program will be able to save a playlist created to view at a later date. -works well
- 3. Users will be able to delete created playlists. -works well
- 4. Program will display created and saved playlists. -works well
- 5. Users will be able to select genre, artist, albums, and songs, to add to the playlists. -works well
- 6. Playlists will be able to be composed of various genres and artists. -works well
- 7. Program will include multiple genres in order to provide a variety of options for the user. -works well
- 8. Program will validate the user input in order to prevent user error. -works well
- 9. Users will be able to generate playlists with only the playlist length and genre imputed. -works well
- 10. Users will be able to control the playlist length of created and generated playlists. -works well
- 11. The user will be able to expand playlists by adding new songs or genres. -works well
- 12. The program will have a graphical user interface (GUI) which will allow for a better user Experience. -works well

Recommendations for Future Improvements

The program meets most of the success criteria that was stated at the beginning of the IA process. The program offers a way for Ms Z to create and manage her playlists despite the areas where improvements can be made.

One area that can be greatly improved is the search functionality of the program. At the moment, there is no search function through the program which makes it difficult for the user to navigate through the entire library of songs, genres, artists, and albums. Because of this, when the point comes that there are dozens of choices, it may become overwhelming for the client to navigate. Because of this, adding a search bar where the user can search for a specific item can make the process much more efficient.

Another area of improvement can be the ability to customize playlists rather than adding songs such as organizing or combining two or more playlists. This would allow the user to have a much more personalized experience and options when deciding to create a playlist. This would also improve the functionality and efficiency of the product.

Even though there are various entries for data handling, the management could be improved through allowing the user to add entire albums and new artists into the playlist without it being pre-imported into the program. This would be helpful for the user to edit the existing playlists directly from the GUI instead of having to manually import the artists beforehand.

Overall, even though the program functions with the criteria the client asked for at the first meeting, there are many areas where it could be improved. The program, once improved, could be used much more functionally and efficiently.
